

VITYARTHI PROJECT

RANDOM MOBILE NUMBER ASSIGNER

NAME-HARSHIT

REGISTRATION NUMBER-26BCE10635

Random Mobile Number Assigner is final project for Vityarhi Python Essentials course. This project is a python-based command line project which is developed using the concepts of Python Essentials teachings. The main purpose of this project is to assign random mobile numbers to users and manage their information through a simple menu-driven interface. This project started from 23 August 2026 to 23 September 2026. This is done during the first semester before advancing into the industrial program. Therefore, it is vital to complete the project to receive a final grade in the effort to put in.

The project uses Python dictionaries to store user information and file handling to save the data in a text file named user.txt. It loads data from user.txt file and can avoid error in case of restarting the program also.

The Vityarhi Project also gives students individual ability and confidence to complete a task under supervision of lectures. With this, Student can learn problem-solving skills in areas of designing analysis, fabrication and testing as well learn to do a complete formatted which is important to future technical writi

OBJECTIVES

- To develop a basic menu-driven application using Python
- To understand the use of dictionaries for storing user information.
- To develop a backend which can assign mobile number using Python's random module.
- To develop duplicate mobile numbers among stored users.
- To learn how read and write data using text files.
- To implement basic operations such as assigning , searching, updating and displaying user's information.
- To understand the work flow and conditional statement implication.
- To understand the use of function that helps in decreasing length of code, repetition of code
- To make familiar the user in syntax of python language very well.

TECHNOLOGIES USED

1. Programming Language: Python 
2. Interface: Command Prompt
3. Storage: users.txt
4. Module: random
5. Software: Visual Studio Code

FEATURES

1. Generating the mobile number:

```
# 1. Generate Random Mobile Number

def genmob():
    while True:
        firstdig=random.choice("6789")
        remainingdig=""
        for i in range(9):
            dig=str(random.randint(0,9))
            remainingdig=remainingdig+dig

        mob=firstdig+remainingdig

        if mob not in users.values():
            return mob
```

2. Assigning the mobile number:

```
#####2.Assign Random Mobile Number#####

def assignnum():
    print("\nAssigning a mobile number to you")

    name=input("Enter your name= ").strip()
    if(name==""):
        print("Name cannot be empty")
        return
    if(name in users):
        print("Name is already registered")

    try:
        age=int(input("Enter the age= "))

        if(age<=0 and age>120):
            print("\nEnter valid age")
            return
    except ValueError:
        print("Age must be a number")
        return

    mob=genmob()

    users[name]={"age":age,"mob":mob}

    print("\nRegistration sucessfully")
    print("Name=",name)
    print("Age=",age)
    print("Assigned Mobile Number=",mob)
```

3. Searching user:

```
#-----  
#=====3.Search User=====  
#-----  
  
def searchuser():  
    print("\n----- Searching User-----")  
  
    name=input("Enter the name= ")  
  
    if(name in users):  
        print("Name is=",name)  
        print("Age is=",users[name]["age"])  
        print("Mobile number is",users[name]["mob"])  
  
    else:  
        print("User not found")
```

4. Displaying User:

```
#----- Display all users-----  
#-----  
  
def displayusers():  
    print("All registered users are following: ")  
  
    if(len(users)==0):  
        print("No user registered in database")  
        return  
  
    count=1  
  
    for name,details in users.items():  
        print("\nUsers",count)  
        print("Name",name)  
        print("Age",details["age"])  
        print("Mobile number",details["mob"])  
  
        count+=1
```

5.Updating User:

```
-----Update user age-----
```

```
def updateage():
    print("\n---Updateding your Age")

    name=input("Enter the name=").strip()
    if(name not in users):
        print("User not found")
        return
    try:
        age=int(input("Enter the age="))
        if(age<0 and age>120):
            print("Enter a valid age")
            return
    except ValueError:
        print("Age must be valid")
        return
    users["age"]=age

    print("Age updated sucessfully")
```

6. Deleting User:

```
#-----DeleteUser-----
#-----
#-----

def deluser():
    print("\n-----Updating user-----")

    name=input("Enter the name=")

    if name in users:
        del users[name]
        print("User deleted sucessfully")

    else:
        print("User not found")
```

7.Count users:

```
#-----Count users-----
#-----

def countusers():
    print("\n Total numberof users are= ",len(users))

#-----
#7.=====Save users=====
#-----

def saveusers():
    with open("Users.txt","w") as file:
        for name,details in users.items():
            age=details["age"]
            mob=details["mob"]

            file.write(name+"|"+str(age)+"|"+mob+"\n")

#-----
#=====
```

7. Saving user's information:

```
#-----  
#7.=====Save users=====  
#-----  
def saveusers():  
    with open("Users.txt","w") as file:  
        for name,details in users.items():  
            age=details["age"]  
            mob=details["mob"]  
  
            file.write(name+"|"+str(age)+"|"+mob+"\n")  
  
#-----  
#=====
```

9. Load Users:

```
#-----  
#=====
```

```
def loadusers():  
    try:  
        with open("Users.txt","r") as file:  
            for line in file:  
                line=line.strip()  
  
                if(line==""):  
                    continue  
                data=line.strip("|")  
  
                if(len(data)==3):  
                    name=data[0]  
                    age=int(data[1])  
                    mob=data[2]  
  
                    users[name]={"age":age ,"mob": mob}  
    except FileNotFoundError:  
        print("No previous data found")  
    except ValueError:  
        print("Invalid data in file")
```

MOBILE NUMBER ASSIGNER"
=====
RANDOM MOBILE NUMBER ASSIGNER=====
Choose your request from given list
Assigning random mobile number code: 1
Search user code: 2
Display all user code: 3
Update age code: 4
Delete user code: 5
Count user code: 6
Exit code: 7
Enter your request code=1

Assigning a mobile number to you
```

```
Enter your name= Harshit
Enter the age= 24

Registration sucessfully
Name= Harshit
Age= 24
Assigned Mobile Number= 8121482855
Want to proceed further? (yes/no): no
REQUEST COMPLETED

Conclusion

shutterstock.com · 2511645971

At last, We can conclude that our project Random Mobile Number Assigner is successfully completed under the guidance of our professor Dr. Prabu Kanna G who helped us in completing this project.

We can also infer that this project helped us to improve our problem-solving skills and understanding the project from end to end.

THANK YOU

HARSHIT
